PROJECT SCOPE

Apple Official

What the online store does, how it's built, and what's left before launch

Apple Official is an online store for the latest iPhone, iPad, Mac and Apple Watch models. Shoppers can browse, compare and buy, and they can get help from an AI assistant that talks in English, Urdu or Hindi, by text or by voice. The store owner runs everything from one admin panel: products, home page, orders, returns, reviews and the AI conversations.

This document is meant to be read in ten minutes. It covers what's in the store today, what each part is for, and the few things we still need to do before real customers arrive.

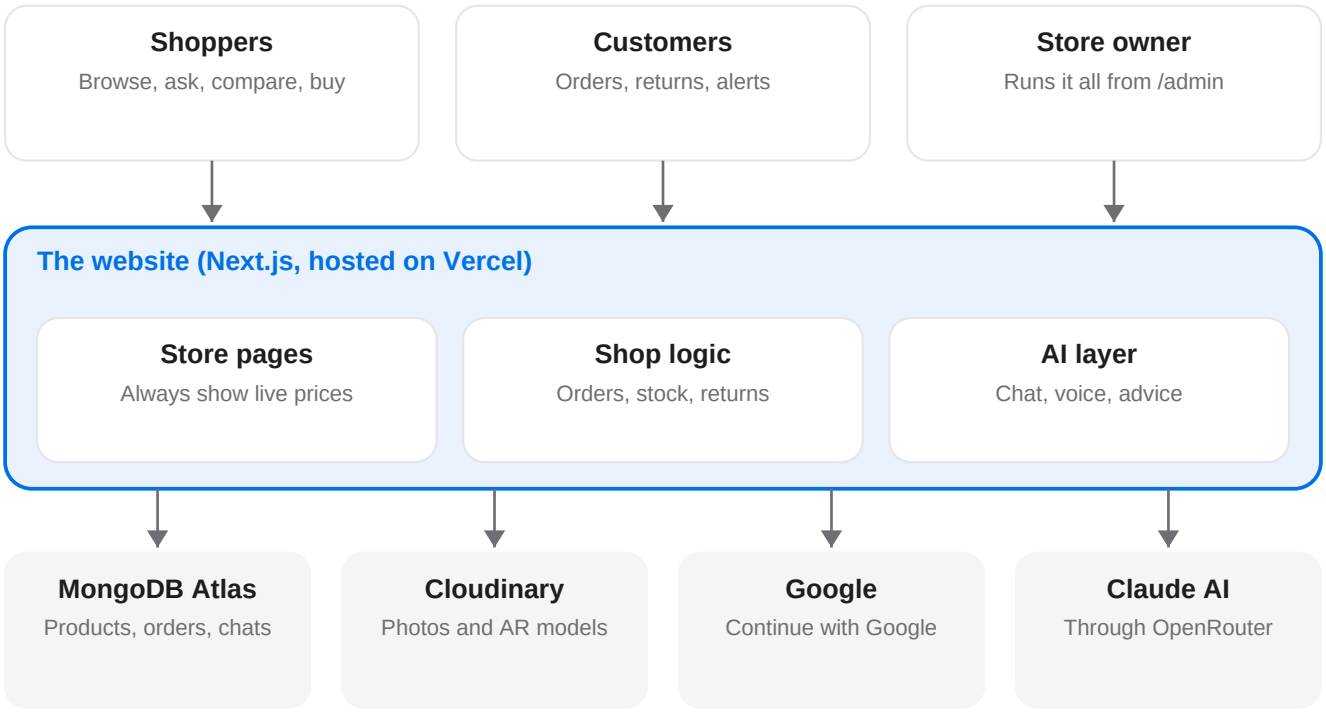
THE BIG PICTURE

How it fits together

It's one website used by three kinds of people. Behind it sit four online services: one keeps the data, one stores pictures, one handles Google sign-in and one powers the AI.



PART	WHAT WE USE	WHY WE PICKED IT
Website	Next.js 16, React 19, TypeScript	Pages load fast and always show the latest prices and stock.
Design	Tailwind CSS with one shared set of colours and sizes	The whole site looks the same everywhere and is easy to restyle.
Database	MongoDB Atlas	Keeps products, orders, customers, reviews, alerts and AI chat history.
Pictures	Cloudinary	Stores product photos, review photos and the 3D models used for AR.
Sign-in	Better Auth, email or Google	Safe customer accounts. The admin has a separate login of its own.
AI	Claude through OpenRouter	Opus 5.5 answers typed chats; Sonnet 5.5 is used for voice because it replies faster.
Hosting	Vercel	Works on localhost, the Vercel preview link and appleofficial.com.

FOR SHOPPERS

The shopping experience

Everything on the store comes straight from the database, so when the owner changes a price or a banner, shoppers see it on their next page load.

AREA	WHAT SHOPPERS GET
Home page	Sliding banners, category banners, newest iPhones, trending products by category, a sale countdown and a short list picked for them by AI.
Collections	Every category with filters for model, stock and price, plus sorting and 12, 24 or 36 products per page.
Search	Forgives typos ("macbok air" still finds MacBook Air), remembers recent searches, takes voice input and can search with a photo.
Product page	Photo gallery, storage and colour choices with their own prices, "frequently bought together", AR view on iPhone and iPad, and a price drop or back-in-stock alert.
Reviews and Q&A	Star ratings with photos and a "verified purchase" badge, an AI summary of what people like and dislike, and questions answered by the store.
Help me choose	A five-question quiz that suggests the best three products for the shopper's budget and needs.
Compare	Pick two or three products and get a side-by-side table with a plain verdict for each need.
Bag and wishlist	The bag checks live stock on its own. The wishlist follows the shopper to any device once they sign in.
Information pages	About, Contact, Jobs, FAQ, Blog, Site Map and the four policy pages.

BUILT-IN AI

Twelve ways AI helps

The AI only recommends products that are actually in the store, at the price shown on the site. Answers are saved for a while, so popular pages like a comparison open instantly the second time.

Shopping assistant

Chat about any product or order, send a photo of a device

Voice shopping

Speak, hear the answer, keep talking; looks and feels like Siri

Ask about a product

Opens the chat already knowing which product you're looking at

Compare with AI

Side-by-side table and a clear "best for camera" style verdict

Review summaries

What customers like and dislike, on every product with reviews

Search with a photo

Upload any phone or laptop and find it, or the closest match

Picked for you

Suggestions based on what you've viewed, saved and bought

Upgrade advisor

"I have an iPhone 13, should I upgrade?" with an honest answer

Gift finder

Who it's for, the occasion and the budget, and it picks the gift

Smart bag check

Storage advice, accessories that pair well, better-value options

Address check

Catches typos in city, street or postal code before payment

Orders in chat

Cancel an order or start a return by asking, with a confirm step

Voice, languages and safety

The assistant understands English, Urdu, Roman Urdu and Hindi, and replies in the same language. In voice mode it waits until you've actually finished your sentence before answering, starts speaking as soon as the first sentence is ready, and listens again when it's done. Only signed-in customers can use the chat, and it never cancels or returns an order without asking first.

BUYING

Checkout in three steps

Shoppers never leave the site to pay. The server always takes the real price and stock from the database, so nobody can change a price from their browser.

1. **Shipping** — Contact details and address, checked by AI for typos
2. **Payment** — Visa, Mastercard, other cards, PayPal or Google Pay
3. **Confirmation** — Order number, delivery date and a summary of the order

- Card numbers, expiry dates and security codes are checked as you type, and the card type is picked from the number.
- Stock goes down the moment an order is placed, so two people can't buy the last item. Cancelling puts it back.
- Order statuses: Placed, Processing, Shipped, Delivered and Cancelled. Delivered orders can be returned within 14 days.

FOR CUSTOMERS

Customer accounts

Customers sign up with email or continue with Google. Once signed in they get their own space.

Overview

Orders, spending and products picked for them by AI

Orders

Every order with its status, plus return progress

Alerts

Price drops and back-in-stock news for watched products

Wishlist

Saved products, on any device

Addresses

Add, edit, remove and choose a default address

Settings

Name, password and the connected Google account

FOR THE STORE OWNER

The admin panel

The admin panel lives at /admin and has its own login, separate from customer accounts. It has eight tools, and nothing in it needs any coding.

Overview

Revenue, orders, customers, low stock and new messages

Home Page CMS

Edit every section: text, images, buttons and products

Inventory

Products, photos, prices, stock and AR models

Orders

Update status and approve or decline return requests

Customers

Each customer with their orders, addresses and cards used

Reviews & Q&A

Hide or delete reviews and answer questions

AI Chats

Every chat with the assistant, kept even if cleared

Messages

Messages sent from the Contact page

- Each chat shows the time of every message, the photos sent, what the AI looked up and anything it did with an order.
- Product ratings update on their own from customer reviews.
- Products can be saved as drafts, which keeps them hidden until they're ready.
- A demo account and sample data can be added with one command for presentations, and removed with another.

PRODUCTS

The catalog

The store starts with 74 of the newest Apple products, with Apple's own photos, colour names and specs.

Prices are in US dollars. Current models use Apple's live prices and older models use their launch price. 16 products also have a 3D model for AR.

BEFORE LAUNCH

What's left to do

The store works end to end and every feature has been tested. These are the things to finish before real customers start paying.

Must do before launch

1. Connect real payments. Orders are saved today, but no money is taken yet. A payment provider needs to be connected so cards are charged securely.
2. Stop storing full card numbers. For testing, orders keep the whole card number. Card industry rules (PCI DSS) don't allow this, so it must be removed. A payment provider makes it unnecessary anyway.
3. Remove the demo data. The sample reviews, demo customer and test chats have to go before launch. One command does it: `npm run demo:remove`.

Good to know

- Voice works best in Chrome and Edge. Edge has a natural Urdu voice; in Chrome, Urdu replies are read out in Hindi script, which sounds the same.
- AR models bigger than 10 MB can't be uploaded on Cloudinary's free plan (MacBook Pro and MacBook Neo for now).
- The AI is billed per use through OpenRouter. Saved answers keep the cost low, but it's worth checking the bill each month.
- The store uses Apple's name and photos. If the store applies for a payment account, the provider may ask about this.

Suggested next phases

PHASE	WHAT IT COVERS
1. Payments	Connect a payment provider, mark orders as paid, refund from the admin, remove stored card numbers.
2. Emails	Order confirmation, shipping updates, password reset, and price drop alerts sent by email too.
3. Growth	Discount codes, more admin users with roles, courier tracking and sales reports by AI.
